

OMAR SHEMY PORTFOLIO

SUBJECT: Unbalanced moment, critical section study

| DATE | PROJECT NO. | PROJECT NAME | ENGINEER | PAGE |
|-------------|-------------|----------------|----------|------|
| 2024 JAN 18 | 202402 | DEMO PORTFOLIO | O.S. | 1 |

1. Study the method of solution of the software in use in the investigation

METHOD OF SOLUTION

density concrete and 1.0 for normal density concrete. Refer to Table 2-1 for determination of concrete type.

$$\sqrt{f'_c} \leq 8 \text{ MPa}$$

When the value of d is greater than 300mm, allowable stress v_c obtained from the above three equations shall be multiplied by $1300/(1000+d)$ as required by CSA A23.3-14/04 code⁹⁰.

The allowable shear stress drops when waffle slabs are used is computed as

$$v_c = \begin{cases} 2\lambda\sqrt{f'_c} & \text{for ACI,} \\ 0.20 \phi_c \lambda \sqrt{f'_c} & \text{for CSA A23.3-94,} \\ 0.19 \phi_c \lambda \sqrt{f'_c} & \text{for CSA A23.3-04.} \end{cases} \quad \text{Eq. 2-46}$$

For waffle slab systems with valid ribs defined earlier in this chapter, the allowable shear stress is increased by 10% for ACI designs.⁹¹

2.11.6 Computation of Factored Shear Force at Critical Section

The factored shear force V_u in the critical section, is computed as the reaction at the centroid of the critical section (e.g., column centerline for interior columns) minus the self-weight and any superimposed surface dead and live load acting within the critical section. If the section is considered open, two 45 degree lines are drawn from the column corners to the nearest slab edge (lines AF and DE in Figure 2-19) and the self-weight and superimposed surface dead and live loads acting on the area ADEF are omitted from V_u .

2.11.7 Computation of Unbalanced Moment at Critical Section

The factored unbalanced moment used for shear transfer, M_{unbal} , is computed as the sum of the joint moments to the left and right. Moment of the vertical reaction with respect to the centroid of the critical section is also taken into account by

$$M_{unbal} = (M_{u,left} - M_{u,right}) - V_u E_g \quad \text{Eq. 2-47}$$

90. CSA A23.3-14, 13.3.4.3; CSA A23.3-04, 13.3.4.3
 91. ACI 318-14, 8.8.1.5, 9.8.1.5; ACI 318-11, 8.13.8; ACI 318-08, 8.13.8; ACI 318-05, 8.11.8; ACI 318-02, 8.11.8; ACI 318-99, 8.11.8

METHOD OF SOLUTION

where

- $M_{u,\text{left}}$ = factored bending moment at the joint on the left hand side of the joint,
 $M_{u,\text{right}}$ = factored bending moment at the joint on the right hand side of the joint,
 V_u = factored shear force in the critical section described above,
 c_g = location of the centroid of the critical section with respect to the column centerline (positive if the centroid is to the right in longitudinal direction with respect to the column centerline).

2.11.8 Computation of Shear Stresses at Critical Section

The punching shear stress computed by the program is based on the following⁹²

$$v_u = \frac{V_u}{A_c} \quad \text{Eq. 2-48}$$

where

- V_u = factored shear force in the critical section described above,
 A_c = area of concrete, including beam if any, resisting shear transfer.

Under conditions of combined shear, V_u , and unbalanced moment, $M_{\text{unbal}} \cdot \gamma_v M_{\text{unbal}}$ is assumed to be transferred by eccentricity of shear about the centroidal axis of the critical section. The shear stresses computed by the program for this condition correspond to⁹³

$$v_{AB} = \frac{V_u}{A_c} + \frac{\gamma_v M_{\text{unbal}} c_{AB}}{J_c} \quad \text{Eq. 2-49}$$

$$v_{CD} = \frac{V_u}{A_c} - \frac{\gamma_v M_{\text{unbal}} c_{CD}}{J_c} \quad \text{Eq. 2-50}$$

92. ACI 318-14, 8.4.4.2.3; ACI 318-11, 11.11.7.2; ACI 318-08; 11.11.7.2; ACI 318-05, 11.12.6.2; ACI 318-02, 11.12.6.2; ACI 318-99, 11.12.6.2; CSA A23.3-14, 13.3.5; CSA A23.3-04, 13.3.5; CSA A23.3-94, 13.4.5.

93. ACI 318-14, R8.4.4.2.3; ACI 318-11, R11.11.7.2; ACI 318-08, R11.11.7.2; ACI 318-05, R11.12.6.2; ACI 318-02, R11.12.6.2; ACI 318-99, R11.12.6.2; CSA A23.3-14, 13.3.5.5; CSA A23.3-04, 13.3.5.5; CSA A23.3-94, 13.4.5.5; Ref. [24]

METHOD OF SOLUTION

where

- M_{unbal} = factored unbalanced moment transferred directly from slab to column, as described above,
 γ_v = $(1 - \gamma_f)$ Eq 2-51
 γ_f is a fraction of unbalanced moment considered transferred by the eccentricity of shear about the centroid of the assumed critical section,⁹⁴
 c = distance from centroid of critical section to the face of section where stress is being computed,
 J_c = property of the assumed critical section analogous to polar moment of inertia.

Factor γ_f in Eq. 2-51 is calculated as⁹⁵

$$\gamma_f = \frac{1}{1 + (2/3)\sqrt{b_1/b_2}} \quad \text{Eq. 2-52}$$

where

- b_1 = width of critical section in the direction of analysis,
 b_2 = width of the critical section in the transverse direction.

If an ACI 318 standard is selected then the program provides an option to use an increased value⁹⁶ of γ_f . For edge and corner columns with unbalanced moment about an axis parallel to the edge, the value can be increased to 1.0 if the factored shear force at the support doesn't exceed $0.75\phi V_c$ for edge columns and $0.5\phi V_c$ for corner columns. For ACI 318-99, ACI 318-02, and ACI 318-05, condition that reinforcement ratio in the effective slab width doesn't exceed $0.375\rho_b$ must also be satisfied to apply the increase. For interior columns and for edge columns with unbalanced moment perpendicular to the edge, γ_f can be increased 25% but the final value of γ_f cannot exceed 1.0. The increase can be applied if the shear doesn't exceed $0.4\phi V_c$. Also, the net tensile strain in the effective slab has to exceed 0.010 for the ACI 318-08, ACI 318-11, and ACI 318-14. For earlier ACI 318 editions, the condition that reinforcement ratio does not exceed $0.375\rho_b$ applies.

spSlab calculates v_u as the absolute maximum of v_{AB} and v_{CD} . Local effects of concentrated loads are not computed by spSlab and must be calculated manually.

2. Study the code definition of the solution being investigated (CL. 13.10.2 CSA A23.3-2019)

7.5 Slab reinforcement

13.10 Slab reinforcement

13.10.1 General

Reinforcement in each direction for two-way slab systems shall be determined from moments at critical sections but shall be not less than that required by Clause 7.8.1.

Note: Where strict crack control is a concern, slabs with drop panels, particularly in a corrosive environment, can require additional reinforcement in the negative middle strip region to limit cracking. This additional reinforcement is not included in the calculation of moment resistance. The reinforcement required to limit cracking is generally more than that required by Clause 7.8.1.

13.10.2 Shear and moment transfer

When gravity load, wind, earthquake, or other lateral forces cause transfer of moment between slab and column, a fraction of unbalanced moment given by

$$\gamma_f = 1 - \gamma_r \quad \text{Equation 13.25}$$

shall be transferred by flexural reinforcement placed within a width b_b .

Note: For exterior supports, including corner columns, Clause 13.10.3 satisfies this requirement.

13.10.3 Exterior columns

Reinforcement for the total factored negative moment transferred to the exterior columns shall be placed within a band width b_b . Temperature and shrinkage reinforcement determined as specified in Clause 7.8.1 shall be provided in that section of the slab outside of the band region defined by b_b , or as required by Clause 13.10.9.

13.10.4 Spacing

Except for portions of slab area that are of cellular or ribbed construction, spacing of reinforcement at critical sections shall not exceed the following limits:

Negative reinforcement in the band defined by b_b : $1.5h_s$, but $s \leq 250$ mm

Remaining negative moment reinforcement: $3h_s$, but $s \leq 500$ mm

Positive moment reinforcement: $3h_s$, but $s \leq 500$ mm

In the slab over cellular spaces, reinforcement shall be provided as required by Clause 7.8.

b_b = width of slab extending $1.5h_s$ past the sides of the column

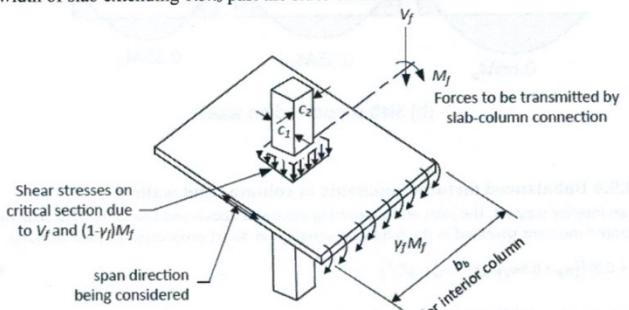

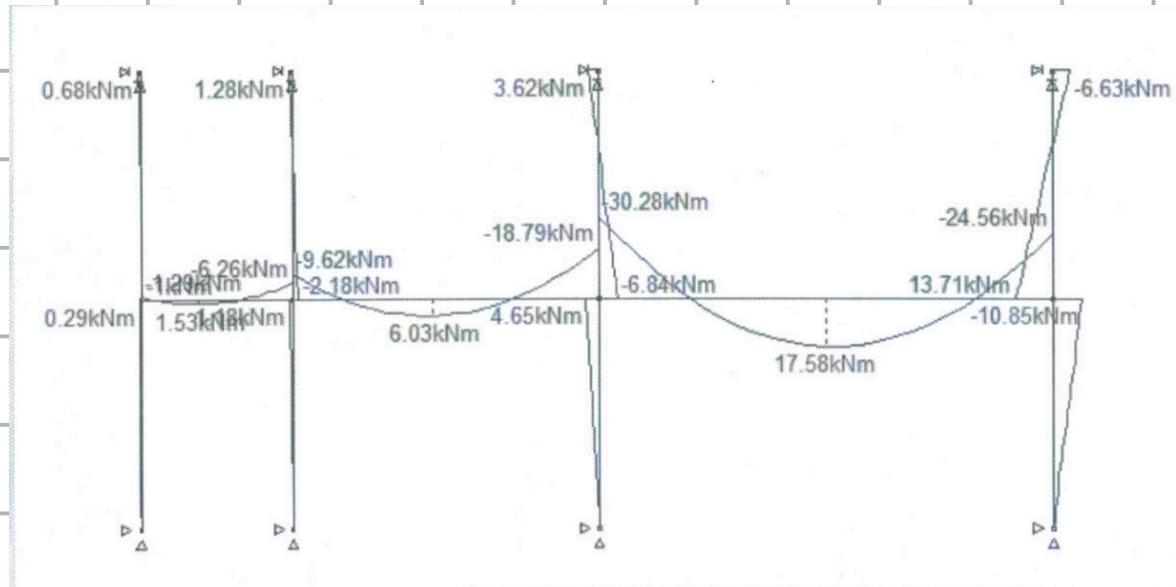

Fig. N13.10.2 Shear and moment transfer at slab-column connections

3. Summarize concepts and definitions:

- a) The unbalanced moment is the moment that is drawn to a column in a column slab/beam assembly.
- b) If you imagine a three-column frame perfectly symmetric with respect to geometry and load, there would be no rotation at the center column joint and therefore no moment would be drawn into the column. The moments on either side of the center column joint would "balance".
- c) That being said, if you take that same frame and make one slab/beam span twice as long as the other, the moment on either side of the center column joints would be unbalanced and a portion (not all) of that unbalanced moment would be supported by the column through two components of force transfer namely:
 - a. eccentric punching shear γ_v and
 - b. flexure in the slab/column joint γ_f .
- d) Functionally, the unbalanced moment is represented by the vertical step in the moment diagram that manifests itself where the slab/beam system passes over the columns.

4. Study the output of the software in use in the investigation

2.8. Bottom Bar Development Lengths

| Span Strip | Long Bars | | Short Bars | |
|--------------------|-----------|--------------|------------|--------------|

2.13. Integrity Reinforcement at Supports

Notes:

The sum of bottom reinforcement crossing the perimeter of the support on all sides shall not be less than the below listed values.

| Support | V _{se} kip | A _{sb} in ² |
|---------|---------------------|---------------------------------|
| 1 | 29.830 | 0.994 |
| 2 | 107.444 | 3.581 |
| 3 | 61.108 | 2.037 |
| 4 | 45.473 | 1.516 |
| 5 | 75.897 | 2.530 |
| 6 | 35.288 | 1.176 |

2.14. Material TakeOff

2.14.1. Reinforcement in the Direction of Analysis

| | | | | | |
|-------------|------------------------|-----|---------------------------|-----|--|
| Top Bars | 1526.8 lb | <=> | 15.42 lb/ft | <=> | 1.008 lb/ft ² |
| Bottom Bars | 1273.4 lb | <=> | 12.86 lb/ft | <=> | 0.841 lb/ft ² |
| Stirrups | 0.0 lb | <=> | 0.00 lb/ft | <=> | 0.000 lb/ft ² |
| Total Steel | 2800.2 lb | <=> | 28.28 lb/ft | <=> | 1.849 lb/ft ² |
| Concrete | 1199.2 ft ³ | <=> | 12.11 ft ³ /ft | <=> | 0.792 ft ³ /ft ² |

5. Verify the output of the software and the method of solution

Joint support 2 (Col. G/3):

Envelope at the joint:

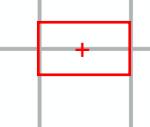

$$\text{From the left} = @10.5 = -128.74 - 37.06 = -165.8 \text{ k.ft } M_{LEFT}$$

$$\text{From the right} = @0.0 = -204.69 - 51.17 = -255.86 \text{ k.ft } M_{RIGHT}$$

$$\text{Unbalanced moment, } M_{unb} = (M_{LEFT} - M_{RIGHT}) - V_u \cdot C_g$$

$$-165.8 - -255.86 - V_u(0) = 90.06 \text{ k.ft}$$

$$C_g = 0$$

Critical section

Support 2:

$$b_1 = 31.59 \text{ in}, \quad b_2 = 19.59 \text{ in}, \quad b_o = 2(b_1 + b_2) = 102.34 \text{ in}$$

$$d_{avg} = 7.59 \text{ in}, \quad A_c = 776.25 \text{ in}^2, \quad J_c = 1.1632 * 10^{15} \text{ in}^4$$

$$V_u = \frac{104.56}{776.25} * 1000 = 134.7 \text{ psi}$$

$$c_{AB} = 15.79 \text{ in}$$

$$v_{AB} = \frac{\gamma_v * M_{unb} * (1000 * 12) * c_{AB}}{J_c}$$

$$v_{AB} = \frac{0.458 * 90.06 * (1000 * 12) * 15.79}{1.1632 * 10^{15}} = 67.2 \text{ psi}$$

$$v_u = 134.7 + 67.2 = 202 \text{ psi}$$
